[-] Abstract and Keywords

This chapter reports authoritative insights into one of the most significant interactions – social network sites – and offers an analytical framework underscoring the centrality of social interaction since the emergence of social network sites (SNSs) presented several characteristics that shaped their profiles. The implicit role of communication and interaction is central for participation. The concept of ‘Web 2.0’ was an industry term adopted by business analysts alike. Social network sites emerged by mixing new technologies and older computer-mediated communication technologies. Server-level data offer a unique opportunity to analyze what users are doing on SNSs.
