The hoarding of food pellets was studied in 72 adult male muroid rodents of ten species; *Mesocricetus auratus*, *Microtus ochrogaster*, *Microtus pennsylvanicus*, *Microtus montanus*, *Peromyscus californicus*, *P. eremicus*, *P. gossypinus*, *P. leucopus*, *Sigmodon hispidus*, and *Meriones unguiculatus*. Seven *Oryzomys palustris* were also studied. *Microtus* and hamsters were the only species to show any appreciable hoarding. Six species were tested for the hoarding of sunflower seeds and corn kernels. Data were consistent with those on the hoarding of food pellets. Although information is incomplete, the ease of eliciting hoarding behavior in the laboratory appears roughly correlated with the tendency to hoard in the natural habitat. No other ecological correlates were apparent.
