## Abstract

The vocal range of 30 geriatric nursing home residents was determined. The

data included mean highest terminal pitch, mean lowest terminal pitch, and mean vocal range. These data were related to those of previous research which investigated the vocal range of college undergraduates. In addition, the vocal range of material published specifically for a geriatric population was assessed. The actual range was compared to this material as well as material written for use with a different population. Discrepancies between these materials and real abilities are noted. Suggestions are made for appropriate modification of published songs through transposition and for revision of future publications to include a generally lower vocal range.
