The use of near vertical incidence skywaves (NVIS) in battlefield communications is now commonplace. Though such until recently, the propagation of HF radio waves over short distances without the intervention of the skip consequence of the use of appropriate frequencies plus transmitting and receiving antennas that favour high ar has occasionally been suggested that the first dedicated use of NVIS techniques took place during conflicts in the evidence exists of its use during the D-Day landings of June 1944. However, wartime documents have recently c show that the British Army Operational Research Group carried out dedicated research into this method of sh communication at least a year earlier and released its reports containing operational recommendations in 1943 of Arnhem.
