## Destination Choice Models for Rock Climbing in the Northeastern Alps: A Latent-Class Approach Based on Intensity of Preferences

Riccardo Scarpa, and Mara Thiene

### Abstract

---

*Rock climbers are likely to exhibit preference heterogeneity dictating the way with which such sport is practiced. This has a reflection on the population's structure of recreational values of rock-climbing destinations, their attributes, and to land management policies. We test this hypothesis on a panel of destination choices by a sample of members of the Italian Alpine Club. Using a latent-class, random utility approach we find evidence in support of the hypothesis that there are at least four classes in the sample, thereby revealing a considerable richness in the structure of preference, which would otherwise be unobservable with more conventional approaches. (JEL Q26, C25)*
