An investigation of changing patterns of entry for GCSE geography: choice, competition

Weeden, Paul (2012)

Ph.D. thesis, University of Birmingham.

Abstract

This study investigates issues of subject Geography is a popular optional subject and Wales at age 14 but between 1996 and entering for the General Certificate of Secondary Education (GCSE) examination declined by 35.6% and entries for GCSE had increased. This study examines the geography subject community better reasons for this decline. The research has used NPD/PLASC data to investigate patterns of geography at the national level. This secondary analysis was developed further through schools which investigated curriculum and competition between subjects at the school level. A conceptual model of the option choice process is the framework for analysis. The results show segregation in entry patterns with high ability and students in less deprived rural counties likely to study geography. Government policies have direct and indirect influences on geography through curriculum decisions made by schools and their pedagogy played a significant role in choice but their influence on numbers choosing the subject can be constrained by whole school and option choice systems.
