Abstract

This paper studies the copper corrosion in simulated uterine fluids in the presence of urea and/or albumin, at pH 5.0, 6.3 and 8.0, with 0.10, 0.15 and 0.20 atmospheres of oxygen pressure and without additional oxygen pressure, at 37°C temperature, and for 1, 3, 7, 15, 21 and 30 days experimentation. The copper dissolution rate was determined using absorbance measurements. Copper dissolution was the highest at pH 8.0 and 0.20 atmospheres of oxygen pressure, $674 \pm 1/4 \text{ g d}^{-1}$ for 1 day and $109 \pm 1/4 \text{ g d}^{-1}$ for 30 days. The presence of albumin, contrary to urea, accelerates copper corrosion.
