Abstract

A new cerambycid beetle (*Qitianniu zhihaoi* gen. et. sp. nov.) is described on the basis of a single specimen embedded in Cretaceous Burmese amber (ca. 99 Ma). Unusual characteristics are hairy antennae and large lateral eyes, a pronotum with lateral margin, and sinuate protibiae. Based on a phylogenetic analysis, the systematic position of *Qitianniu* is still uncertain and we provisionally place it as Cerambycidae *incertae sedis*.
