Abstract

Ten popular species of both edible and medicinal Korean mushrooms were analysed for their free amino acids and disaccharides. The average total free amino acid concentration was 120.79 mg g^{-1} in edible mushrooms and 61.47 mg g^{-1} in medicinal mushrooms, respectively. The average total of free amino acids for all mushrooms, edible mushrooms and medicinal mushrooms was 91.13 mg g^{-1} . *Agaricus blazei* (227.00 mg g^{-1}) showed the highest concentration of total free amino acids; on the other hand, *Inonotus obliquus* (2.00 mg g^{-1}) showed the lowest concentration among the 10 species of mushrooms. The average total carbohydrates concentration was 46.67 mg g^{-1} in the 10 species of mushrooms, where the edible mushrooms contained 66.68 mg g^{-1} and the medicinal mushrooms contained 26.65 mg g^{-1} . The carbohydrates constituents of the 10 mushroom species were mainly mannose

(36.23%), glucose (34.70%), and xylose (16.83%).
