Forty-six male wheelchair basketball players performed a set of field tests to evaluate aerobic capacity (25 m shuttle run), anaerobic capacity (30 s sprint), and six specific wheelchair basketball skills. Overall test-

retest reliability ($n = 20$) ranged from $r = 0.65$ to $r = 0.97$. To study the validity (criterion related evidence) of the shuttle run test, heart rate (HR) was recorded for 15 subjects, who also performed a continuous, multistage arm cranking exercise until volitional fatigue. Moderate to high correlations were calculated between shuttle run distances covered ($1375 \pm 243,6$ m) and $\dot{V}O_2\text{max}$ (2208 ± 461.6 mL/min) and PO_{max} (93.8 ± 17.97 W), measured during maximal arm cranking (respectively $r = 0.64$ and $r = 0.87$). Maximal HR during shuttle run (174.9 ± 16.6 B/min) and arm cranking (169 ± 14.21 B/min) were correlated ($r = 0.78$). High correlations between shuttle run test and anaerobic field tests, however, indicate high implication of anaerobic and wheelchair manoeuvrability performances. The 30 s sprint test was validated ($n = 15$) against a Wingate Anaerobic Test (WAnT) on a roller ergometer. Comparing distance (field test: 90 ± 6.7 m) with mean power output (WAnT: 852.1 ± 234.9 W) the correlation was $r = 0.93$. Principal components factor analysis identified 'wheelchair propulsion dynamics' and 'eye-hand-coordination' as the underlying constructs of the six skill proficiency measurements, accounting for 80.1 % of the variance. In conclusion, the newly developed field test battery is a reliable and valid tool for anaerobic capacity and skill proficiency assessment in wheelchair basketball players.

Key words:

Field test - aerobic capacity - anaerobic capacity - skill proficiency - wheelchair - basketball
