AbstractAbstract

[en] The aim of this book is to present a broad synoptic view of the many varieties of charged-particle beams which have been studied in connection with a wide range of practical devices. Classification is in terms of essential physical features, rather than applications, and is related to underlying principles of optics, classical and statistical mechanics, and plasma physics. In this way diverse viewpoints are brought together, and secondary concepts which have emerged in connection with different applications are compared. The subject is dealt with in chapters entitled: introduction; beam optics and focusing systems; laminar beams with self-fields; non-laminar beams without collisions; beams with scattering or dissipation; waves and instabilities in beams.
