#### Publisher Summary

This chapter discusses the phonetic structure of partially nasal consonants and it reviews the types of such consonants known to occur, and presents some interpretations of the ways that the phonetic patterns relate to phonological structures. The phrase, partially nasal consonants, is intended to describe only segments that contain a part that is a nasal in the traditional phonetic use of that term. The class of segments discussed in the chapter is the one that consists of an interval of time that is considered to be a single consonantal element but which contain a subpart during which the velopharyngeal port is open and the oral escape of air is blocked. The chapter presents the distinctions between underlying and derived prenasalized stops. The prenasalized stops are persuasively analyzed as single segments from the phonological point of view. There are stops of two types, voiceless oral and voiced prenasalized. These two types of stop have the same distributional patterns.
