### Abstract

The preparation and structure elucidation of cocrystals **1a**, **1b**, **2a**–**4a**, formed from cyanuric acid (**CA**) and the aza-donor compounds 4,7-phenanthroline, 1,7-phenanthroline, phenazine and 1,3-bis(4-pyridyl)propane, respectively, have been reported. While **CA** forms different types of self-assembling modes—monomers (**1a**), dimers (**1b** and **4a**) and infinite tapes (**2a** and **3a**)—the recognition of the constituents, however, is through a triple hydrogen-bonding pattern, consisting of an N–H<sup>+</sup>–N and two C–H<sup>+</sup>–O hydrogen bonds, except in **4a**.
