Abstract:

Guided by participatory research and implementation science, we conducted a two-phase study to contextualize a mental health intervention for its implementation settings. Drawing from research and existing programs, we created a consultation and coaching intervention delivered by indigenous school and community mental health professionals. We examined effective classroom interactions for children with behavioral difficulties and their classmates. Administrators, classroom teachers, and mental health professionals from one community agency and five urban elementary schools participated. The study involved analysis of qualitative data from collaborative research to inform refinement to training, content, delivery, and implementation. It also involved analysis of mixed method implementation data from a pilot experimental trial of the adapted program to integrate mental health and teacher support models into a feasible and relevant program for the urban school context. Implications of the research framework for school psychology and prevention science are discussed.
