Nutrition of the chicken.

Author(s): SCOTT, M. L.; NESHEIM, M. C.; YOUNG, R. J.

Abstract: "This book", say the authors, "has been written to serve as a textbook for undergraduates, a ready reference and text for graduate students, and a source of information for the research worker and the practicing nutritionist." The first two categories may be rather better served than the third, but the research worker is likely to use such a book mainly as "background" and to that extent he too may be satisfied. There is a selected bibliography for each chapter, the chapters dealing with the proximate constituents, vitamins, minerals, non-nutritive feed additives, interrelations affecting requirements, feed-stuffs for poultry and feed formulation, and finally with measurements of nutritive quality. The chapters on feedstuffs and feed formulation are based on
American materials and methods and some tables are in terms of the hybrid unit mg per pound. Amino acids are expressed as percentages of air-dry feed, not in relation to nitrogen. There is a section on the use of computers in feed formulation.-D. L. Duncan.
