## Resumen

Implementation of shared queues (lock-free)

## Descripción

The transactional framework used to develop Amadeus C++ applications is based on a mechanism of queues to manage the message exchanges between components. These structures are protected from concurrent access thanks to synchronization services provided by Linux. But these services have a cost in terms of performance and they bound the volume of messages transmitted by these queues. In a first step, I have to investigate on the state-of-the-art in terms of management algorithms of synchronization-free queue (Lock-Free Queue). Several algorithms will be studied for different cases: 1 Producer – 1... [+]
