Abstract: The alternative title is "The basis of veterinary clinical pharmacology" author emphasizes in the preface that, despite the widespread use of drug animals, most Schools of Veterinary Medicine still place little emphasis on cli
pharmacology in their curricula. The dose of a drug required to produce optimum effectiveness in an animal can either be derived mathematically or from several years of clinical evaluation. The opening chapter contains a useful account of drug translocation including the principles of drug transport across biological membranes. Drug absorption is comprehensively covered in the next chapter with particular emphasis on bio-availability. The author then follows the logical sequence of drug distribution, biotransformation, excretions followed by an elaboration of the principles of pharmacokinetics and dosage. Finally, there is a short section on drug therapy in neonatal animals.
