## Undertaking Sensitive Research: Issues and Strategies for Meeting the Needs of All Participants

*Heather McCosker, Alan Barnard, Rod Gerber*

### Abstract

There are many phenomena that within specific cultural and social contexts are defined as "sensitive" if they are private, stressful or sacred, and discuss sensitive topics such as death and sex. Phenomena that deal with potentially sensitive topics, such as the study of sub-cultures, and studies that may reveal information of a political nature are also considered "sensitive". In response to the "sensitive" nature of such phenomena, researchers must act as gatekeepers during the research process to protect individuals and/or groups from harm. Experience and a review of current literature clearly indicates that individuals are affected by the research. The researchers, transcribers, supervisors and participants are placed at risk. This risk may be physical and/or psychological. In order to ensure psychological safety protocols or guidelines need to be developed at the outset to identify and minimise risk, or respond to risk as they arise during the research process.
