An Investigation Of The Effects Of Digital Flash Cards To Increase Biology Vocabulary Knowledge In High School Students With Learning Disabilities

[Kelly J. Grillo, University of Central Florida](#)

Keywords

Biology -- Study and teaching (Secondary), High school students
Word recognition

Abstract

The field of science education, specifically biology, is becoming richer and more rigorous content demands. Along with new demands of National Common Core Standards and End of Course Examinations, one factor remains consistent: As content knowledge increases, so does the demand for vocabulary. For students with learning disabilities (LD), specifically reading-based disabilities, the increasing vocabulary demand can lead to difficulties of understanding biology but the vocabulary associated with t

to impact high school students with learning disabilities' success intervention was investigated. Research suggests as more and compressed into science courses, teachers are looking toward vocabulary mastery. The current research study examined the card intervention, Study Stack, versus a paper flash card intervention students with LD by measuring students' word knowledge and achievement. Findings from repeated measures ANOVA show an increase on both the vocabulary assessment as well as the course grade. However, the test of between effects considering card type showed no change on vocabulary assessment and course grades in biology. Data, students interviewed liked the tool and found it to be helpful terminology.
