## Abstract

Floral fragrance compounds of five species *Anthurium armeniense*, *A. fragrantissimum*, *A. lindenianum*, *A. ochranthum* and *A. roseospadix*, and three hybrids of *A. armeniense* were studied using headspace adsorption and solvent extraction for sample preparation followed by capillary GC and GC-MS analysis. Twenty eight compounds were identified and their levels (%) assessed at the scent-emitting pistillate stage of the spadix. Variation of compounds in the headspace in response to the time of day were determined in a hybrid, *A. antioquiense* 'Atsuta Pink Obake'™ (UH1299), which emitted strong fragrance all day. Chemical profiles from the headspace and from spadices soaked in CH<sub>2</sub>Cl<sub>2</sub> were compared in three species. Combination of these two data sets would provide more complete chemotaxonomic

profiles in *Anthurium*.
