**Abstract**
Examines the uses of collaboration in environmental and natural resource policy decision making and conflict management.

Environmental and natural resource policy decision making is changing. Increasingly, citizens and management agency personnel are seeking ways to participate meaningfully in the decision making process as parties work through policy conflicts. Doing things differently has come to mean doing things collaboratively. Enter search terms:
Daniels and Walker examine collaboration in environmental decision making and conflict management. They address collaboration through collaborative learning, a method designed to address decision-making and conflict-management needs in complex and controversial policy settings. Collaborative learning differs in significant ways from existing approaches for dealing with policy decision making, public participation, and conflict management. First, it is a hybrid of systems thinking and alternative concepts. Second, it is grounded explicitly in experiential, team, and adult learning theories. It is a theory-based framework through which parties can make progress in the management of controversial environmental policy situations. They discuss both the theory and technique of collaborative learning and how it has been applied. This is a professional and teaching tool for researchers involved with environmental issues as well as dispute resolution.
