Mammals of Bolivia : taxonomy and distribution. Bulletin of the A no. 231

Anderson, Sydney, 1927-

URI: <http://hdl.handle.net/2246/1620>

Date: 1997

Abstract:

"Studies of published records and of about 36,900 specimens of native mammals from Bolivia reveal that 327 species occur there. Probably more than 20 other species, either new to science or new to Bolivia, will be discovered. In addition to these species names, some 44 additional subspecies names are used. Many subspecies names reflect taxonomic history more than detailed knowledge of geographic variation. In the taxonomic status of each taxon within Bolivia is noted. Scientific names that have been used for specimens are given for each species and subspecies, and all known publications that have specifically dealt with Bolivian specimens are cited, along with a few other works selected for special reasons. Specimens and localities are mapped, including the prediction of the probable distribution of each species with illustrations. Illustrated keys are based primarily on external, cranial, and dental characters and include 10 domestic introduced species in addition to native species. The number of species present in most local areas range from about 50 to 180. Analysis indicates four major faunal areas: lowland tropics, lowland temperate zone (the chacoan area), forested yungas, and highlands (altiplano). The highland and lowland faunas are mutually exclusive; the break between temperate and tropical is indistinct"--P. 3.

- [Bulletin of the American Museum of Natural History](#)

The Bulletin, published continuously since 1881, consists of longer monographic volumes in the natural sciences relating to zoology, paleontology, and geology. Current numbers are published at intervals. The Bulletin was originally a place to publish short papers, while longer works appeared in the Memoirs. However, in the 1920s, the Memoirs ceased and the Bulletin series began publishing longer papers. A new series, the Novitates, published short papers describing new forms.
